

Introduction

TL;DR. *Simulates skills client-side, eliminating ping-based delays and animation lock.*

Does this mean my ping will effectively be lower?

No. What the module does is attempt to avoid the restrains caused by ping on skills and so letting the player interact with skills in the intended way. Please do remember that skill emulation isn't perfect(or can be due to the lack of server side support) and the module's accuracy is heavily affected by the user's **network quality, natural ping and fps stability**.

What about PvP, does it work with no affairs?

While the module does support PvP in certain areas it doesn't fully do it or does it perfectly manage player's position as per the server will expect, it's **not recommended for this purpose**. Furthermore, the module can be deactivated in-game via accessing the command `/8 sp off`, more info can be found in [skill-prediction\docs\commands.pdf](#) locally or hosted [here](#).

Notes:

- It can get you banned due to possible desync and further users report. Use at own risk.

Installation

1. Download the module via clicking in the button [Clone](#) or [Download](#) and then on [Download Zip](#).
2. Uncompress and place the resulting folder in [Tera-proxy\bin\node_modules](#) and you're set.
3. Make sure that Windows Game mode isn't enabled since it can delay the proxy and thus the skills and everything else.

Notes:

- It's strongly recommended that you utilize the module in conjunction with **Caali's proxy version** since that will let the module update itself and have the needed **tera-data** available. Its can be found on his [discord server](#).

Usage

The module by itself doesn't require you to do anything in-game to then make use of it. It's instead suggested that you do take a look at users documentation in the folder `skill-prediction\docs\` locally or hosted in the [wiki](#).

Troubleshooting

Currently, help will be provided in [Caali's Proxy and Private server development discord](#).

Something doesn't work in-game?

Open an issue in [SP Issues](#), and please follow the [Bug report guide](#) if you don't already know how to properly do it.
